

CompE565: Multimedia Communication Systems

Rules of HW Coding Style

There will be several homework assignments in this course, each one may have several problems, and each problem may generate multiple output images. You should make your source codes and output images well organized. Please carefully follow the following instructions.

1. IMAGE FILE FORMAT

In this course, we will use .jpg format to represent an image.

2 PROGRAMING LANGUAGE

2.1 Matlab

Your solution must include a readme file with the name README. This file is very important for the grader to simulate and grade your homework. You may lose points if this file is missing or not properly prepared, which makes the grader unable to evaluate your work. The file should include the following:

1. Homework number
2. Each student's Name and ID
3. Description of your submitted M-files: how to invoke, how to choose the arguments and where is the output image, etc.

It is encouraged that you make the README an executable M-file. For this, you can put all your execution commands into file. After README is invoked at MATLAB prompt, it will simply run all the M-files of your homework sequentially. A sample README.m file:

[illegible]

3 CODE ORGANIZATION

Each Assignment will have a few questions. You should successfully complete Q1 before attempting Q2. Therefore, there is no need to submit a .m file for each question. If you are not using functions, all questions should be encoded in one file.

1. All functions must be called through your main .m file. Example: If each Q is a function, then call all the functions in main().
2. Readme should contain clear instructions on how to execute your code and what outputs to expect.
3. If your main file is Readme.m, then indicate on top of the Readme file that the grader should execute this file.
4. Only read your input once so that the grader can easily change directory on their system.
5. Code should be well indented, commented and all the variables should be labelled appropriately.

4 SUBMISSION INSTRUCTIONS

Submit your homework via Canvas by the due date.

1. Submit your **Report** and **Source Code** in **separate files**; **DO NOT zip them in one file**.
2. Your **Report** should include all the results – see the **Student Report Guidelines**.
3. Do include a README file with your Source Code file; You can zip them together in a single directory.
4. The name of Report and Source Code files should reflect the 'HW Component' and each Student's Id (e.g., HW1_XXXXXX or HW1_XXXXXX_XXXXXX when two students are involved).
5. Also DO NOT forget to include your Name and Id in each Source Code file and README file.
6. **ONLY ONE REPORT PER GROUP SHOULD BE UPLOADED TO CANVAS.**
